

JETA3000-H-LP

Features

- Output power up to 3000 W, 25 W/inch³
- Operating case temperature -50 ... +95 °C
- Efficiency up to 94 %
- Case dimensions 300x170x39 (mm) A7
- CNC milled case
- Component polymer potting protection
- Input ranges:
 "230" (184-264 VAC, 1ph., 50 Hz) standard,
 other voltage ranges on request
- Remote ON (OFF)
- Active parallel operation
- Power Good (OGOOD) indication
- Max output capacitance unlimited
- Additional temperature sensor for operation in air-tight equipment (on request)

Description

JETA-LP series of 1-phase AC/DC isolated power supply units meant for operation in harsh environmental conditions, **providing high voltage output 200-400 VDC** for various applications including **tethered drone systems**. The combination of electro-technical and mechanical parameters creates versatility for the series to be used in various application fields: both low and high altitude in unprotected equipment compartments, in all types of transport, in supercomputers, in low and high temperature environments, digital signage equipment, in radar systems. The series is an optimal fit for any environment which requires low-profile, minimized dimensions and weight, high efficiency and wide temperature range.

Base models (1 channel)						
Model part number Input voltage		Output power	Output voltage	Output current per channel	Typical efficiency at 70 % load	
JETA3000-H-LP-230S200-W-A7	184-264 VAC	3000 W	200 VDC	15.00 A	93 %	
JETA3000-H-LP-230S300-W-A7	(230 VAC nom.)	3000 W	300 VDC	10.00 A	93 %	
JETA3000-H-LP-230S400-W-A7	or DC equivalent	3000 W	400 VDC	7.50 A	93 %	

Additional ordering information:

- 1) The units may be provided with a different range of input voltage on request, please see available ranges in our selection guide.
- 2) Units with non-standard output voltage may be provided on request.
- 3) Units with non-standard output power may be provided on request.

Minimal connection scheme

In any system application it's necessary to at least use minimal connection scheme consisting of components shown on the picture.

C out - chosen in accordance with Technical Reference Manual (see on our website).

Power-temperature relationship

Additional application information

1. Value of case temperature

The case temperature is measured at the middle of the long side of the case base. When using a thermocouple, it is necessary to attach the thermocouple conductors to the base surface at a distance of at least 20 mm from thermocouples head. The thermocouple measuring end and its conductors must be covered with a layer of heatconducting paste 2-3 mm thick to provide correct measurements.

2. Possible cooling methods

- 1) Conductive cooling with aluminum (or copper) heatsink or coldplate, with base at least 2 mm thick.
- 2) Forced air.
- 3) Convectional heatsink cooling with vertical orientation of itself and vertical orientation of its ribs for free air flow from bottom to top.

To use the units without a heatsink it's necessary to consult with the producer.

Most of the unit's dissipated heat (93-95 %) is concentrated on the BOTTOM SIDE of the unit (fully metal surface) which must be attached to the heatsink-coldplate or ribbed heatsink surface. Requirements for the heatsink surface (preferably CNC milled) - flatness tolerance of the heatsink surface must be lower than 0.1 mm per 100 mm of length.

3. Unit heatsink fixation

Mounting screws tightening order should be following: first the central screw (mandatory if available), then one pair of diagonally placed screws, then another pair of diagonally placed screws. First installation of the screws should be done without force. Then all the screws should be tightened with the recommended torque.

For quality contact between the unit and a heatsink - it's necessary to use thermal conductive paste with thickness less than 0.1 mm, with thermal conductivity greater than 2 W/K.m. The paste must be applied with mesh stencil in a pattern of squares (i.e. 2x2 mm to 4x4 mm squares mm with 0.5-1 mm spacing between the squares). This allows paste to be evenly spread in a thin layer and excess air to escape when tightening screws during unit mounting.

4. Short-term unit operation

If it's necessary to shortly turn on the unit for 3-5 minutes (for example for input-control testing), an aluminium (copper) coldplate must be used as a heatsink. Its width and length must be not less than of the unit itself, with thickness at least 20 mm. The unit must be placed on coldplate through a thin (0.15-0.3 mm) silicone-based heatconducting sheet.

JETA3000-H-LP

5. Thermal protection tripping

When internal unit's thermal protection is tripped the unit is turned off (until automatic restart) and "OGOOD" outputs state becomes high-resistance (where available). Such state should lead to measures of forced heatsink cooling, for example via fans turn-on. Time before automatic restart of the unit after thermal protection tripping can last from several seconds up to several minutes depending on thermal inertia of the heatsink. For units meant to operate in airtight equipment - on request it's possible to include additional thermal sensor to monitor ambient temperature of air closest to the unit's surfaces.

6. Operation with shorted outputs

The units have a short-circuit output protection. The protection is for emergency only, not for long-term operation. It's prohibited to use the units with shorted outputs (the units have the special detectors inside).

7. Reliability of in-parallel connected units system

To maximize reliability of in-parallel connected units system (for case of failure of one in-parallel connected units), with minus outputs (-OUT) directly connected together - plus outputs (+OUT) should be connected through separating diodes. Usually, Schottky diodes with breakdown voltage at least twice of unit's output voltage are used for such purpose. PAR outputs of all in-parallel connected units must be directly connected together.

Only units delivered within one order are guaranteed to be properly operating while utilizing active parallel function. Please consult with us if you'd like to set-up active parallel operation of units from different orders or batches.

If you have any questions, please contact us directly at aeps@aeps-group.cz.
